**Re: UE \_\_\_ – Idaho Power Company’s 2021 Annual Power Cost Update (APCU).**

Attention Filing Center:

Enclosed for filing in the above-referenced matter are two copies of Idaho Power Company’s Direct Testimony and Exhibits of Nicole A. Blackwell (Idaho Power/100-110). Please direct all communications in this matter to:

Lisa Nordstrom  
Idaho Power Company  
P.O. Box 70  
Boise, ID 83707/0070

IN THE MATTER OF IDAHO POWER )  
COMPANY'S 2021 ANNUAL POWER )  
COST UPDATE )  
OCTOBER UPDATE )  
\_\_\_\_\_ )

**IDAHO POWER COMPANY**  
**DIRECT TESTIMONY**  
**OF**  
**NICOLE A. BLACKWELL**

**October 30, 2020**

1 **Q. Please state your name, business address, and present occupation.**

2 A. My name is Nicole A. Blackwell. I am employed by Idaho Power Company (“Idaho  
3 Power” or “Company”) as a Regulatory Analyst in the Regulatory Affairs Department.  
4 My business address is 1221 West Idaho Street, Boise, Idaho 83702.

5 **Q. Please describe your educational background.**

6 A. In May 2010, I received Bachelor of Science degrees in Finance and Economics from  
7 the University of Idaho. I have also attended “The Basics: Practical Regulatory  
8 Training for the Electric Industry,” an electric utility ratemaking course offered through  
9 New Mexico State University’s Center for Public Utilities, “Electric Utility Fundamentals  
10 & Insights,” an electric utility course offered through the Western Energy Institute, and  
11 Edison Electric Institute’s “Electric Rates Advanced Course.”

12 **Q. Please describe your business experience with Idaho Power.**

13 A. In January 2016, I accepted my current position at Idaho Power as a Regulatory  
14 Analyst in the Regulatory Affairs Department. As a Regulatory Analyst, I am  
15 responsible for running the AURORA model (“AURORA”) to calculate net power  
16 supply expenses (“NPSE”) for ratemaking purposes, as well as the determination of  
17 the marginal cost of energy used in the Company’s marginal cost analyses. My duties  
18 also include providing analytical support for other regulatory activities within the  
19 Regulatory Affairs Department.  
20

21 **Q. What is the purpose of your testimony in this proceeding?**

22 A. The purpose of my testimony is to present the determination of the Company’s 2021  
23 October Update, the first portion of the Company’s Annual Power Cost Update  
24 (“APCU”). If approved, the 2021 October Update will result in a revenue increase of  
25 \$1.2 million, or a 2.37 percent increase in base revenue collection, to become effective  
26

1 June 1, 2021.

2 **Q. How is your testimony organized?**

3 A. My testimony begins with a brief history of the APCU and the filing requirements  
4 associated with it. Next, my testimony describes the required updates to AURORA  
5 and the resulting modeling outputs. I then present and discuss the total NPSE for the  
6 2021 October Update, and how it compares to last year's 2020 October Update. My  
7 testimony concludes with the quantification of the projected revenue requirement and  
8 the proposed rate implementation to recover the revenue requirement.

9 **Q. Have you prepared exhibits for this proceeding?**

10 A. Yes. I am sponsoring the following exhibits:

- 11 1. Exhibit 101, AURORA modeled determination of normalized power supply
- 12 expenses for April 1, 2021 – March 31, 2022
- 13
- 14 2. Exhibits 102 – 104, Mid-Columbia Forward Price Curves Discounted for Inflation,
- 15 Producer Price Index for Electric Power, and Forward Prices Used for Re-Pricing
- 16 Purchased Power and Surplus Sales
- 17
- 18 3. Exhibit 105, Total Normalized Base Power Supply Expenses for the 2021 October
- 19 Update
- 20
- 21 4. Exhibit 106, Energy Imbalance Market Benefits
- 22
- 23 5. Exhibit 107, Energy Imbalance Market Costs
- 24
- 25 6. Exhibit 108, Year-Over-Year Differences in Modeled NPSE
- 26
- 27 7. Exhibit 109, Revenue Spread
- 28
- 29 8. Exhibit 110, Revenue Impact

**APCU Overview**

30 **Q. What is the APCU?**

1 A. The APCU is a rate mechanism that is comprised of two components, an October  
2 Update and a March Forecast. The October Update establishes the prospective  
3 “base” or “normal” power supply expenses for an April through March test period. The  
4 March Forecast is a forecast of expected power supply expenses over the same test  
5 period as the October Update. “Base” or “normal” power supply expenses are  
6 calculated by modeling the test period under multiple historical water conditions; in this  
7 case, the Company modeled 92 historical water conditions (1928-2019). Expected  
8 power supply expenses are calculated by modeling the same test period as the  
9 October Update, except the power supply expenses are calculated by modeling a  
10 single forecast water condition from the Northwest River Forecast Center. The results  
11 of the October Update are reflected as an update to base rates and the results of the  
12 March Forecast are reflected in the March Forecast Rate Adjustment listed in  
13 Schedule 55, with both of the rate adjustments going into effect on June 1<sup>st</sup> of each  
14 year.  
15

16 **Q. What is the definition of the term “net power supply expense” as the Company**  
17 **and the Public Utility Commission of Oregon (“Commission”) have used the**  
18 **term historically?**

19 A. The Company and the Commission have used the term “net power supply expense”  
20 to refer to the sum of the following Federal Energy Regulatory Commission (“FERC”)  
21 accounts: fuel expense (FERC Accounts 501 and 547), and purchased power  
22 expenses (FERC Account 555), minus surplus sales revenues (FERC Account 447).

23 **Q. What regulatory actions led to the implementation of the APCU?**

24 A. In its Order issued in Idaho Power’s rate case, the Commission specifically recognized  
25 the Company’s unique reliance on hydro generation and its extended amortization of  
26

1 deferred costs, and therefore, directed the parties to work together to “consider  
2 whether there is a more effective regulatory mechanism for Idaho Power to recover its  
3 allowable power costs.”<sup>1</sup> Following that Order, the Company filed its request for a  
4 power cost adjustment mechanism (“PCAM”). The result of that filing was a settlement  
5 stipulation approved by the Commission in Order No. 08-238<sup>2</sup>, establishing the APCU  
6 and implementation of the PCAM, or the annual power supply expense true-up.

7 **Q. What is the purpose of the APCU?**

8 A. The APCU was implemented to adjust rates on an annual basis to capture variability  
9 in power supply expenses that occur with a predominantly hydro-based generation  
10 fleet. The APCU mechanism closely aligns the power supply expenses included in  
11 customer rates with the power supply expenses actually incurred by the Company.  
12 Prior to the APCU, the Company would defer excess power supply expenses and then  
13 amortize them at a later time for collection, which led to multiple deferrals and long  
14 amortization periods.

15  
16 **Q. What are the requirements of Order No. 08-238?**

17 A. Order No. 08-238 directed the Company to model its power supply expenses using  
18 the AURORA model and identified a number of variables that were to be updated  
19 annually in AURORA. The specific variables are discussed in the following section.

20 **Q. What is the AURORA model?**

21 A. The AURORA model is a comprehensive electric resource dispatch model that  
22 simulates the economic dispatch of the Company’s resources to determine NPSE for  
23

---

24 <sup>1</sup> *In the Matter of Idaho Power Company Application for General Rate Increase in the Company’s  
Oregon Annual Revenues*, Docket No. UE 167, Order No. 05-871, p. 7 (July 28, 2005).

25 <sup>2</sup> *In the Matter of Idaho Power Company Application for Authority to Implement a Power cost  
26 Adjustment Mechanism for Electric Service Customers in the State of Oregon*, Docket No. UE 195, Order No. 08-  
238 (April 28, 2008).

1 the APCU. The Commission has also accepted the use of AURORA to determine  
2 NPSE for general rate cases, marginal cost analyses, and resource modeling for the  
3 Company's Integrated Resource Plan ("IRP").

4 **AURORA Model Inputs and Modeling Results**

5 **Q. What are the specific variables that are to be updated during each APCU filing?**

6 A. Commission Order No. 08-238 identified the following power supply expense variables  
7 to be updated annually:

- 8 a. Fuel prices and transportation costs
- 9 b. Wheeling expenses
- 10 c. Planned outages and forced outage rates
- 11 d. Heat rates
- 12 e. Forecast of normalized load and normalized sales
- 13 f. Contracts for wholesale power and power purchases and sales
- 14 g. Forward price curve
- 15 h. Public Utility Regulatory Policies Act of 1978 ("PURPA") contract expenses
- 16 i. The Oregon state allocation factor

17  
18 The Company reviewed all the inputs and updated those that have changed since last  
19 year's October Update, as described in more detail in the following sections.

20 **Coal Fuel Expense**

21 **Q. Have any changes in coal fuel expense and coal-fired generation occurred since**  
22 **last year's October Update filing?**

23 A. Yes. Total coal fuel expense included in the 2021 October Update is \$53.4 million,  
24 compared to \$40.8 million in the 2020 October Update, an increase of 31 percent.  
25 Coal-fired generation also increased from last year's October Update, from 1.05 million  
26

1 megawatt-hours (“MWh”) to 1.45 million MWh, or approximately 38 percent.

2 **Q. How did the changes in coal fuel expense and coal-fired generation impact the**  
3 **cost of coal production on a per-unit basis?**

4 A. The average cost of coal production, on a per-unit basis, for the 2021 October Update  
5 is \$36.94 per MWh, compared to \$38.90 per MWh for the 2020 October Update. At  
6 the plant level, the per-unit cost of production decreased 10 percent at the Jim Bridger  
7 plant (“Bridger”) and decreased less than 1 percent at the North Valmy plant (“Valmy”).

8 **Q. What factors are driving the changes in the per-unit cost of production at**  
9 **Bridger?**

10 A. The per-unit cost of coal production at Bridger decreased 10 percent year over year  
11 due to a 9 percent reduction in coal costs, on a dollar per MMBtu basis. The decline  
12 in coal costs is driving an increase in AURORA-modeled economic dispatch, resulting  
13 in a lower per-unit cost of production.  
14

15 **Q. What is causing the reduction in dollar per MMBtu coal costs at Bridger?**

16 A. The decrease in coal costs at Bridger is due to an increase in expected burn levels at  
17 the plant, which is being driven by forward market electricity prices. At the time the  
18 coal fuel forecast was prepared for the 2021 October Update, Intercontinental  
19 Exchange Mid-Columbia (“Mid-C”) forward market electric prices supported increased  
20 economic dispatch of Bridger for the 2021 APCU test period. As a result of higher  
21 production at the plant, fixed costs are spread over larger volumes causing a decrease  
22 in the cost of coal. Appropriately, this lower coal price input into the AURORA model  
23 is causing an increase in AURORA-modeled production at Bridger.

24 **Q. Did Idaho Power model OHAG expenses as agreed upon in the settlement**  
25 **stipulations approved in the 2016 and 2017 APCU dockets?**  
26

1 A. Yes. Per the settlement stipulation approved in the 2016 APCU<sup>3</sup>, the per-MWh OHAG  
2 expense included in the AURORA model has been updated to reflect the amount of  
3 OHAG expense driven by Idaho Power's dispatch of the Bridger and Valmy plants.  
4 The Company has separately accounted for its proportional share of the total OHAG  
5 expense incurred at both plants. Per the settlement stipulation approved in the  
6 Company's 2017 APCU<sup>4</sup>, Idaho Power's proportional share of total OHAG expense  
7 incurred at both of the coal-fired plants is forecast using a three-year historical average  
8 of actual OHAG costs, with a growth (reduction) rate equal to the five-year historical  
9 average growth (reduction) rate.

10 **Q. Have you prepared an exhibit that illustrates the calculation of OHAG expenses**  
11 **for the 2021 APCU?**

12 A. Yes. Exhibit 101 reflects the AURORA-modeled OHAG expense resulting from Idaho  
13 Power's dispatch, as well as Idaho Power's fixed ownership share of total OHAG  
14 expense at both of its coal-fired plants. This methodology effectively includes in the  
15 AURORA dispatch price the true variable component of OHAG driven by the  
16 Company's dispatch of each plant. After the AURORA-modeled dispatch has  
17 occurred, the resulting costs are adjusted to align with costs actually incurred by the  
18 Company at both of its coal-fired facilities.

19  
20 For example, on Exhibit 101, Line 4 illustrates the AURORA-modeled OHAG  
21 expense resulting from Idaho Power's dispatch of Bridger. Line 5 is the difference  
22 between the total AURORA-modeled expenses, Line 3, and the AURORA-modeled  
23

---

24 <sup>3</sup> *In the Matter of Idaho Power Company's 2016 Annual Power Cost Update*, Docket No. UE 301, Order  
25 No. 16-206 (May 31, 2016).

26 <sup>4</sup> *In the Matter of Idaho Power Company's 2017 Annual Power Cost Update*, Docket No. UE 314, Order  
No. 17-165 (May 16, 2017).

1 OHAG expense, Line 4, at Bridger ( $\$39,870.5 - \$1,235.5 = \$38,635.0$ ). Line 6  
2 represents the Company's proportional share of total OHAG expenses at Bridger using  
3 the stipulated methodology discussed above. Line 7 is the sum of the AURORA-  
4 modeled expenses (less the AURORA-modeled OHAG at Bridger, Line 5), and the  
5 Company's proportional share of total OHAG, Line 6, ( $\$38,635.0 + \$2,923.0 =$   
6  $\$41,558.0$ ). This line reflects the NPSE for Bridger for the 2021 October Update. This  
7 method is replicated for Valmy as shown on Lines 9-14.

8 **Q. Does Idaho Power's 2021 APCU account for revenues received from or**  
9 **expenses paid to NV Energy (its ownership partner in Valmy) for usage of the**  
10 **Company's unused capacity or the Company's usage of NV Energy's unused**  
11 **capacity?**

12 A. Yes. Per the settlement stipulation approved in the 2017 APCU<sup>5</sup>, Idaho Power agreed  
13 to include the three-year historical average of actual net balances associated with  
14 ownership partner use of unused capacity at Valmy as an offset or addition to total  
15 NPSE. However, for the 2021 October Update, Idaho Power adjusted the calculation  
16 to account for the exit of Valmy Unit 1 in 2019. Specifically, the three-year average  
17 calculation was reduced by the Unit 1 share of capacity at Valmy, which is  
18 approximately 49 percent.<sup>6</sup> As a result, the APCU no longer reflects forecast benefits  
19 or costs associated with partner usage of Valmy Unit 1.

20  
21 For the 2021 October Update, the 2017-2019 historical average net revenue  
22 paid to Idaho Power associated with NV Energy's dispatch of Idaho Power's unused  
23 capacity at Valmy Unit 2 is \$56,416 on a system basis. As shown on Line 13 of Exhibit  
24

---

25 <sup>5</sup> *Id* at 4.

26 <sup>6</sup> Valmy Unit 1 capacity represents 127 MW of the total 260 MW plant capacity, or 49 percent.

1 101, this amount has been reflected as an offset to NPSE for Valmy for the 2021  
2 October Update. The Company will update the three-year historical average as part  
3 of the 2021 March Forecast.

4 Natural Gas Fuel Expense

5 **Q. How does the natural gas price forecast for the 2021 October Update compare**  
6 **to last year's October Update?**

7 A. The Henry Hub price used for the 2020 October Update was \$2.71 per MMBtu, while  
8 the Henry Hub price used in the 2021 October Update is \$2.88 per MMBtu, an increase  
9 of \$0.17 per MMBtu or 6 percent.

10 **Q. How is the Henry Hub gas price forecast used as an AURORA input?**

11 A. The Company uses the gas price forecast for Henry Hub as the starting point in the  
12 AURORA model. Henry Hub is considered a reference fuel in AURORA, meaning  
13 other gas market prices are determined by applying an adjustment factor to the Henry  
14 Hub price. For example, a Henry Hub gas price of \$2.88 per MMBtu applied to a  
15 Sumas basis of \$0.10 per MMBtu equals a Sumas gas price of \$2.98 per MMBtu  
16 ( $\$2.88 + \$0.10 = \$2.98$ ). The Company develops a separate gas price for its natural  
17 gas units also based upon the Henry Hub gas price forecast, referred to as the Idaho  
18 Citygate price.  
19

20 **Q. Please explain the Idaho Citygate price.**

21 A. The Idaho Citygate price is representative of the gas price delivered to Idaho Power's  
22 natural gas units. The Idaho Citygate price is based on the Henry Hub price and  
23 applies adjustments for Sumas basis and transport costs.

24 **Q. How does the Idaho Citygate price for the 2021 October Update compare to last**  
25 **year?**  
26

1 A. The average Idaho Citygate price for the 2021 October Update is \$3.02 per MMBtu  
2 compared to \$2.12 per MMBtu for the 2020 October Update.

3 **Q. What is driving the increase in the Idaho Citygate price?**

4 A. The increase in the Idaho Citygate price for the 2021 October Update is attributable to  
5 increases in the Henry Hub price as well as the Sumas basis, which are both impacted  
6 by lower natural gas supply and rising demand. The reduction in natural gas production  
7 levels is primarily due to the coronavirus pandemic, which has resulted in spending  
8 cuts for the exploration and production of natural gas. As a result of lower natural gas  
9 production during the winter of 2020, the U.S. Energy Information Administration  
10 (“EIA”) forecasts inventory draws will outpace the five-year average during the  
11 2020/2021 heating season. According to EIA, inventory levels of natural gas at April  
12 2021 will be 6 percent lower than the five-year average.<sup>7</sup> In addition to the drop in  
13 production and inventory, the Coronavirus pandemic is driving an increase in natural  
14 gas demand as more people are working and attending school at home, which is  
15 contributing to higher-than-normal levels of home heating use. The combination of  
16 lower natural gas supply and higher demand is driving the year over year increase in  
17 natural gas prices included in the APCU October Update.  
18

19 PURPA Expense

20 **Q. Please explain any changes in PURPA generation since last year’s October**  
21 **Update.**

22 A. Last year’s October Update included 345 average megawatts (“aMW”) of PURPA  
23 generation, whereas PURPA generation included in the 2021 October Update is 348  
24

25 \_\_\_\_\_  
26 <sup>7</sup> U.S. Energy Information Administration Short-term Energy Outlook. October 2020.  
[https://www.eia.gov/outlooks/steo/pdf/steo\\_full.pdf](https://www.eia.gov/outlooks/steo/pdf/steo_full.pdf)

1 aMW, an increase of 3 aMW, or less than 1 percent. The increase in PURPA  
2 generation is primarily due to normal fluctuations in estimated output from the  
3 Company's 134 PURPA generation facilities.

4 **Q. Have there been any changes in the number of PURPA projects since last year?**

5 A. The 2021 October Update reflects the addition of three new PURPA projects, as well  
6 as the termination of two projects. The new PURPA projects include an 800 kilowatt  
7 hydro facility, a 3 MW solar facility and a 2.28 MW cogeneration facility. The terminated  
8 projects include two biomass projects totaling 6.78 MW.

9 **Q. How has the annual PURPA expense changed from last year's October Update?**

10 A. Annual PURPA expense increased from \$223.6 million to \$231.2 million, an increase  
11 of \$7.6 million, or 3 percent. The increase in annual PURPA expense is a combination  
12 of the small increase in forecasted generation discussed above as well as updated  
13 PURPA contract values.

14  
15 Normalized Load

16 **Q. Please describe the changes in the Company's system loads since last year's  
17 October Update.**

18 A. The Company's normalized system load used in last year's October Update was 1,861  
19 aMW. The Company's normalized system load used in this year's October Update is  
20 1,868 aMW, representing an increase in load of 7 aMW, or less than 1 percent,  
21 between the two test periods.

22 Other

23 **Q. What other AURORA inputs were modified from last year's October Update?**

24 A. The Company updated the maintenance rates, forced outage rates, and heat rates for  
25 its thermal plants, which is a consistent practice for every APCU filing.

Modeling Results

**Q. Have you prepared an exhibit that summarizes the results of the AURORA model with all of the updated inputs described above?**

A. Yes. Exhibit 101 shows the results of the AURORA modeling determination of normalized NPSE for the April 2021 through March 2022 test year. Exhibit 101 presents the summary of results containing average variable power supply generation output and expenses based on 92 historical water conditions.

**Q. Please summarize the sources and disposition of energy shown on Exhibit 101.**

A. As can be seen on Exhibit 101, hydro generation supplies 8.8 million MWh, approximately 51 percent (8.8 million MWh / 17.4 million MWh = 51 percent) of the generation mix. Thermal generation supplies 3.7 million MWh (Bridger 1.2, Valmy 0.3, Langley Gulch 1.9, Danskin 0.2, Bennett Mountain 0.1), approximately 21 percent (3.7 million MWh / 17.4 million MWh = 21 percent) of the generation mix. Purchases of power are made up of short-term and longer-term market purchases, purchased power agreements (“PPA”), and PURPA. PURPA purchases reflect normalized and annualized generation levels and account for 3.0 million MWh. The generation amounts and costs associated with PURPA purchases are not shown on Exhibit 101; however, when combined with market purchases of 1.3 million MWh and PPAs of 0.6 million MWh, total purchases amount to 4.9 million MWh (3.0 million MWh + 1.3 million MWh + 0.6 million MWh = 4.9 million MWh) or approximately 28 percent of the generation mix. Of the 17.4 million MWh generated by the system, 16.4 million MWh are utilized for system loads while 1.0 million MWh are sold as surplus sales.

**Base Net Power Supply Expenses**

1  
2 **Q. How are the Base Net Power Supply Expenses to be calculated for the October**  
3 **Update portion of the APCU according to the settlement stipulation approved in**  
4 **Order No. 08-238?**

5 A. Per Order No. 08-238, the output of the AURORA model will be used to determine net  
6 power supply average dispatch cost for normal loads and average stream flow  
7 conditions, and the wholesale electric prices for purchased power and surplus sales  
8 determined by the AURORA model will be replaced with an average forward electric  
9 price curve.<sup>8</sup>

10 **Q. Please describe the re-pricing methodology mentioned above.**

11 A. The Company is required to re-price the AURORA-generated volumes of purchased  
12 power and surplus sales with a forward-based price curve using the Mid-C hub. This  
13 methodology prescribes the use of a one-year average of the daily Mid-C forward price  
14 curves calculated from the previous 12 months of daily Mid-C heavy load and Mid-C  
15 light load forward price curves for the period starting in the April immediately following  
16 the current April through March test period. Forward prices are then adjusted for  
17 inflation back one year using the most recent Producer Price Index for Electric Power.  
18

19 The re-pricing of market prices in the 2021 October Update is based upon the  
20 daily forward price curves for April 2022 through March 2023 as shown in Exhibit 102,  
21 which were then discounted for inflation back to April 2021 through March 2022  
22 according to the quarterly inflation indices provided in Exhibit 103.

23 **Q. What is the monthly average forward price that is used for the re-pricing of**  
24 **purchased power and surplus sales volumes?**

25  
26 <sup>8</sup> Order No. 08-238 at 3.

1 A. Exhibit 104 shows the monthly prices that are used for the re-pricing of purchased  
2 power and surplus sales volumes for the 2021 October Update. The prices range from  
3 a low of \$8.46 per MWh to a high of \$50.42 per MWh.

4 **Q. How does the re-pricing of purchased power and surplus sales, using a normal**  
5 **forward price curve, change purchased power expenses and surplus sales**  
6 **revenues as modeled by AURORA?**

7 A. Lines 27 and 35 of Exhibit 101 show the purchased power expenses and surplus sales  
8 revenues, respectively, as determined by the AURORA modeling process. Lines 18  
9 and 26 of Exhibit 105 show the same normalized generation dispatch with purchased  
10 power and surplus sales re-priced using the normalized forward price curve shown in  
11 Exhibit 104. A comparison of Exhibit 101 and Exhibit 105 demonstrates the changes  
12 due to re-pricing. Purchased power expenses increased by \$3.2 million, moving from  
13 \$41.1 million to \$44.3 million. Surplus sales revenues decreased by \$0.2 million,  
14 moving from \$20.9 million to \$20.7 million. In this case, the NPSE resulting from the  
15 re-pricing methodology shown on Exhibit 105 is an increase in NPSE of \$3.4 million  
16 as compared to the AURORA-generated expectation shown on Exhibit 101. The  
17 differences for the re-pricing of purchased power of \$3.2 million and surplus sales of  
18 \$0.2 million are shown on Exhibit 108, Column J.  
19

20 *EIM Benefits and Costs*

21 **Q. Has the Company adjusted the NPSE amounts included in the 2021 October**  
22 **Update to reflect Idaho Power's participation in the Western EIM?**

23 A. Yes. The NPSE requested for approval in the 2021 October Update includes both the  
24 incremental benefits and costs associated with Idaho Power's participation in the  
25 Western EIM. Because the cost-savings benefits associated with EIM participation  
26

1 will be reflected as decreased NPSE, the Company believes it is appropriate to include  
2 an estimate of both the incremental benefits and the incremental costs required for  
3 participation as part of this APCU.

4 **Q. What level of EIM benefits is Idaho Power proposing to include in the 2021**  
5 **October Update?**

6 A. Idaho Power is proposing to include \$14.6 million in system EIM benefits as an offset  
7 to NPSE in the 2021 October Update. On an Oregon allocated basis, the EIM benefits  
8 to be included in the 2021 October Update total are \$658,254.

9 **Q. How does this compare to the level of EIM benefits included in last year's**  
10 **October Update?**

11 A. The settled 2020 October Update system EIM benefit was \$16.9 million, or \$769,144  
12 on an Oregon allocated basis.

13 **Q. How did the Company determine the level of EIM benefits to be included in the**  
14 **2021 October Update?**

15 A. The level of EIM benefits to be included in the 2021 October Update utilizes the  
16 California Independent System Operator ("CAISO") report of EIM benefits, for August  
17 2019 through July 2020, as a starting point, and then accounts for necessary  
18 adjustments to quantify ongoing cost savings benefits specific to Idaho Power's  
19 participation in the EIM. These adjustments, which I will detail individually, include an  
20 adjustment to the CAISO methodology as it pertains to the hydro pricing cost structure,  
21 and an adjustment for third-party load included in the Company's balancing area.

22 **Q. How does CAISO quantify EIM benefits?**

23 A. CAISO uses a counterfactual methodology in which dispatch for an EIM Balancing  
24 Authority Area ("BAA") mimics market operations without importing or exporting  
25  
26

1 through EIM transfers. The counterfactual dispatch moves units inside the BAA to  
2 meet real-time imbalance based on economic merit order. CAISO's quantification of  
3 total estimated EIM benefits is the cost savings of the EIM dispatch compared to the  
4 counterfactual without EIM dispatch. In order to determine both EIM dispatch costs  
5 and counterfactual costs, CAISO relies upon bid prices submitted by EIM entities.

6 **Q. What concerns does the Company have regarding CAISO's EIM benefits**  
7 **methodology as it relates specifically to Idaho Power?**

8 A. One of the major assumptions CAISO makes in its benefits methodology, due to lack  
9 of other data, is that the bids submitted for each participating resource reflect the true  
10 dispatch costs, or the economic value, of those resources. For most resource types,  
11 this assumption may be reasonable; however, this assumption is not accurate for  
12 hydro resources.

13  
14 Idaho Power bids hydro resources based on an operational need rather than  
15 actual dispatch cost. Additionally, Idaho Power utilizes various pricing tiers for its hydro  
16 resources to protect the water from overuse in the market and to adhere to regulated  
17 water management policies.<sup>9</sup> The pricing tiers that Idaho Power uses are based upon  
18 certain operational parameters and can result in high bid prices when it is necessary  
19 to cease or limit water flows for a particular hydro resource's market participation.  
20 When Idaho Power operators move water into the higher tiers, which have a higher  
21 bid price, it is a response to operational needs and does not reflect market benefits.

22 Without adjusting for these operating scenarios, CAISO's EIM benefit  
23 methodology incorrectly reflects the bid tier price as the economic value of hydro in  
24 the determination of both counterfactual costs and EIM dispatch costs, thereby  
25

---

26 <sup>9</sup> Requirements may include flood control obligations, fish flow obligations, etc.

1 overstating the resulting benefits. In order for the EIM benefit calculation to properly  
2 serve as an adjustment to modeled NPSE, Idaho Power made adjustments to the  
3 CAISO methodology as it pertains to the hydro pricing cost structure.

4 **Q. Please describe the changes Idaho Power made to the hydro pricing cost**  
5 **structure for purposes of the EIM benefit calculation?**

6 A. To reflect the correct economic value of the hydro dispatches in the EIM benefit  
7 calculation, Idaho Power made a two-part adjustment to the hydro cost structure. First,  
8 all hydro dispatch costs are held constant by applying a zero-cost. This satisfies a  
9 correction to CAISO's EIM counterfactual costs as there should not be any costs  
10 associated with Idaho Power's dispatching up and down of its hydro resources to meet  
11 its load imbalances.

12  
13 Holding the dispatch costs constant by applying a zero-cost also satisfies a  
14 correction to the EIM dispatch costs. The EIM is not a capacity market. Therefore, in  
15 a hydro system with limited ability to store water long-term, EIM imports (or the  
16 dispatching down and storage of the water) will have matching exports over a given  
17 time period (that water will be exported soon thereafter). When EIM hydro imports  
18 match exports over a measured period, in the case of Idaho Power's analysis an hourly  
19 basis<sup>10</sup>, dispatch costs should be held constant by replacing all tier prices with a zero  
20 cost. In this scenario, the actual benefit is the difference between the EIM import and  
21 export price. If the EIM dispatch cost isn't held constant over the measured period, it  
22 results in an inaccurate benefit.

23 However, when hydro imports do not equal exports, it is necessary to value, or  
24

---

25 <sup>10</sup> The adjustments to the hydro pricing cost structure for the EIM benefit calculation are performed on  
26 an hourly basis at the recommendation of OPUC Staff. *In the Matter of Idaho Power Company's 2020 Annual  
Power Cost Update*, Docket UE 366, Idaho Power/300, Blackwell/17-18 (March 24, 2020).

1 assign a cost to, the net import/ exports to the market. This is the second part of the  
2 adjustment Idaho Power made to the hydro pricing cost structure as it pertains to the  
3 EIM benefit calculation.

4 **Q. Why is it necessary to value net imports and exports related to the EIM?**

5 A. When imports exceed exports during the measured period, using a zero-cost value  
6 will underestimate benefits because it does not properly account for the value of  
7 imported energy that serves load (rather than hydro) and provides a benefit to the  
8 Company's customers. Conversely, when exports exceed imports during the  
9 measured period, the zero-cost value will inflate benefits because there aren't any  
10 costs assigned to the water that was moved into the market. In either scenario, the  
11 net imports/ exports for the hydro resources will show a benefit at the EIM Locational  
12 Marginal Price ("LMP") because there are no costs associated with the hydro  
13 dispatches. As a result, it is necessary to make a second adjustment to the EIM benefit  
14 calculation to properly account for the hydro cost when imports do not equal exports  
15 for the measured period.

16  
17 **Q. Please explain the methodology used by the Company to value EIM net imports  
18 and exports of hydro-related energy.**

19 A. Idaho Power adjusted the EIM benefits by replacing the zero-priced dispatch cost with  
20 the Powerdex Mid-C hourly market electricity price for all hours that the Company was  
21 a net importer or net exporter. Applying a market price to the net hydro import/ export  
22 position allows the Company to properly account for the cost savings associated with  
23 imported energy that served load rather than hydro, or the costs associated with hydro  
24 energy exported to the EIM. The market prices were multiplied by the net import/  
25 export position and the adjusted cost savings/costs was applied to the zero-cost  
26

1 benefit method to accurately calculate EIM benefits for hydro resources.

2 **Q. Did Idaho Power prepare an Exhibit to illustrate the adjustments to the hydro**  
3 **pricing cost structure of the EIM benefit calculation?**

4 A. Yes. Exhibit 106 demonstrates Idaho Power's adjustments to the CAISO EIM benefit  
5 methodology as it pertains to the hydro pricing cost structure for the full 12-month  
6 period. Column A of Exhibit 106/1 includes CAISO's reported benefits for Idaho Power  
7 for August 2019 – July 2020 of \$23.2 million. Column B illustrates Idaho Power's  
8 application of a zero-cost for all hydro tier prices when EIM imports equal exports on  
9 an hourly basis. This adjustment resulted in an EIM benefit of \$18.6 million, a \$4.6  
10 million reduction from CAISO's stated EIM benefits for Idaho Power.

11  
12 Column C of Exhibit 106 demonstrates the adjustment to the hourly net import/  
13 export position for the hydro resources. As discussed previously, Idaho Power  
14 assigned a value to the net import/ export position for each hour based on the  
15 Powerdex Mid-C market electricity price. This adjustment resulted in a \$2.9 million  
16 reduction to the EIM benefit estimate.

17 Exhibit 106 also illustrates an adjustment related to third-party loads in the  
18 Company's BAA that are included in CAISO's benefit calculation.

19 **Q. Please explain the adjustment for benefits related to third-party loads in the**  
20 **Company's BAA that are included in CAISO's benefit calculation.**

21 A. The benefits reported by CAISO reflect a value for the entire BAA each month.  
22 However, the Company has third-party load in its BAA whose benefits are being  
23 included in CAISO's reported benefits for Idaho Power. To better determine the  
24 benefits attributable to Idaho Power, the Company developed a method to reflect the  
25 monthly third-party load EIM benefits based on a load ratio allocation between Idaho  
26

1 Power load and third-party customer loads in the Idaho Power BAA. Idaho Power also  
2 applied this adjustment to the 2019 and 2020 APCU EIM benefit calculations.

3 **Q. Please describe the adjustment to allocate a portion of the EIM benefits to third-**  
4 **party load.**

5 A. The Company applied the monthly percentage of transmission load ratio share  
6 attributable to its third-party load customer for August 2019 through July 2020. This  
7 calculation determined that on average, approximately 7.24 percent of the BAA load  
8 relates to the third parties. In order to only include EIM benefits related to the  
9 Company, the EIM benefit was reduced by \$1.1 million, which reflects the 7.24 percent  
10 of the third-party load EIM benefits.

11 **Q. Please summarize the final estimate of EIM benefits to be included in the 2021**  
12 **APCU.**

13 A. The Company's EIM benefits forecast is based on the CAISO's EIM benefits reports,  
14 with necessary adjustments for hydro pricing and third-party loads as described in this  
15 testimony. As detailed in Exhibit 106, the Company's total estimated benefit for April  
16 2021 through March 2022 is \$14.6 million, or \$0.66 million on an Oregon jurisdictional  
17 basis. The Company has included the estimate of EIM benefits as an offset to forecast  
18 NPSE for the October Update as shown in Exhibit 105.

19 **Q. Please describe the incremental costs of Western EIM participation.**

20 A. As stated previously, by participating in the Western EIM, the Company achieves  
21 NPSE savings, which benefit customers; however, to achieve such benefits, Idaho  
22 Power has incurred, and will continue to incur, incremental costs to participate in the  
23 Western EIM, including software and metering investments and annual, ongoing  
24 operations and maintenance ("O&M") expenses. Consistent with the 2019 and 2020  
25  
26

1 APCU dockets, the Company has included EIM-related costs in the 2021 APCU. The  
2 EIM-related costs included in the 2021 October Update consist of the annual return on  
3 net rate base from the capital investment required to participate in the Western EIM,  
4 depreciation expense, and ongoing O&M expenses. On an Oregon allocated basis,  
5 the revenue requirement associated with EIM costs to be included in the 2021 October  
6 Update is \$146,504, as shown in Exhibit No. 107.

7 **Q. Why does the Company believe the APCU is the appropriate mechanism to**  
8 **recover EIM-related costs?**

9 A. Over the long term, the Company envisions that both the benefits and costs associated  
10 with EIM participation would be reflected in base rates as addressed in a general rate  
11 case. However, because the timing of the Company's next general rate case is  
12 unknown, it is necessary to utilize an interim rate mechanism for cost recovery to  
13 provide for proper matching of costs and benefits in customer rates.

14  
15 Since participation in the Western EIM began in April 2018, the Company, and  
16 ultimately its customers, have achieved cost-saving benefits. As these benefits are in  
17 the form of reduced NPSE, it is appropriate to recover the costs of EIM participation  
18 under the mechanism in which NPSE is recovered. Including the EIM-related costs in  
19 the 2021 APCU is necessary to ensure that customer rates reflect a proper matching  
20 of EIM benefits and costs and to prevent intergenerational inequities. This treatment  
21 was approved by the Commission in Idaho Power's 2018, 2019 and 2020 APCU  
22 dockets, Docket Nos. UE 333, UE 350, and UE 366 in Order Nos. 18-170, 19-189 and  
23 20-164.

24 Per-Unit Cost Calculation and NPSE Discussion

25 **Q. What is the NPSE per-unit cost when you combine all of the quantifications**  
26

1 **described earlier?**

2 A. Exhibit 105 shows total system NPSE of \$403.4 million and normalized annual sales  
3 at the customer level for the April 2021 through March 2022 test year of 15,035,589  
4 MWh, resulting in a per-unit cost for the 2021 October Update of \$26.83 per MWh  
5 (\$403.4 million / 15.035 million MWh = \$26.83 per MWh) to become effective on June  
6 1, 2021.

7 **Q. How does the 2021 October Update per-unit cost of \$26.83 per MWh compare to**  
8 **the 2020 October Update per-unit cost?**

9 A. The 2020 October Update per-unit cost, which became effective June 1, 2020, was  
10 \$25.02 per MWh based upon a determination of total NPSE of \$375.6 million.

11 **Q. Has the Company prepared an exhibit that demonstrates the changes in NPSE**  
12 **as compared to last year?**

13 A. Yes, Exhibit 108 compares the AURORA-developed results, the re-pricing of  
14 purchased power and surplus sales, and the differences between the 2020 October  
15 Update and the 2021 October Update. Column H of Exhibit 108 shows the following:  
16 (1) An increase in coal expenses of \$12.7 million associated with an increase of 0.40  
17 million MWh in generation, (2) a decrease in natural gas expenses of \$8.1 million  
18 associated with a decrease of 0.83 million MWh in generation, (3) an increase in  
19 market purchased power expenses of \$0.27 million associated with an increase of  
20 0.16 million MWh, (4) an increase in PPA expenses of \$4.4 million associated with an  
21 increase of 0.05 million MWh, (5) an increase in PURPA expenses of \$7.6 million  
22 associated with an increase of 0.03 million MWh, and finally, (6) a decrease in surplus  
23 sales revenue of \$8.6 million associated with a decrease of 0.24 million MWh.

24 **Q. Can you elaborate more on the changes in generation from the 2020 October**  
25

26

1       **Update to the 2021 October Update?**

2    A.    To illustrate the changes in generation, Columns D (2020) and F (2021) of Exhibit 108  
3       calculate the percentage of generation compared to total system load. For example,  
4       Column F, line 1, shows that hydro provided 54 percent of the generation to meet the  
5       total system load of 16,363,166 MWh ( $8,821,097 / 16,363,166 = 54$  percent). A  
6       comparison of the 2021 October Update to the 2020 October Update demonstrates  
7       that hydro generation was unchanged at 54 percent, coal generation increased from  
8       6 percent to 9 percent, natural gas generation decreased from 19 percent to 14  
9       percent, market purchased power increased from 7 percent to 8 percent, PPA  
10       generation increased from 3 percent to 4 percent, PURPA generation remained  
11       unchanged at 19 percent, and lastly, surplus sales decreased from negative 8 percent  
12       to negative 7 percent. This comparison between resource type and total system load  
13       shows that reduced natural gas generation is being met with increased coal generation  
14       and market purchases and has also reduced the opportunity to make economic off-  
15       system sales.  
16

17    **Q.    Are the changes in expenses among resource types consistent with the changes**  
18    **in output?**

19    A.    Yes. The changes in expenses among resource types are relatively consistent with  
20       the changes in output. The changes in expenses for each resource type are also  
21       shown in Columns D (2020) and F (2021) of Exhibit 108 as follows: Coal expense  
22       increased from 11 percent to 13 percent of total NPSE, natural gas expense decreased  
23       from 18 percent to 15 percent, market purchased power expense decreased from 12  
24       percent to 11 percent, PPA expense was unchanged at 12 percent, PURPA expense  
25       decreased from 60 percent to 57 percent, and surplus sales revenue decreased from  
26

1 8 percent to 5 percent. Exhibit 108 demonstrates that the majority of movement in  
2 NPSE is related to natural gas, coal, and surplus sales which is consistent with the  
3 changes in generation.

4 **Q. What can be concluded from the information presented in Exhibit 108?**

5 A. The information shown in Exhibit 108 confirms that the increase in forecast natural gas  
6 fuel costs as well as the decrease in coal fuel costs, discussed previously in my  
7 testimony, are causing natural gas generation to be displaced with coal-fired  
8 generation. This is particularly evident with the Company's natural gas peaker plants,  
9 which are forecast to generate 64 percent less than in last year's October Update.  
10 Additionally, the increase in forecast natural gas prices and subsequent reduction in  
11 generation is reducing the Company's' ability to make economic off-system sales.

12 **Q. Did the Company comply with the methodology in Order No. 08-238 when it**  
13 **performed its analysis to determine the NPSE for the 2021 October Update?**

14 A. Yes. The Company has complied with the methodology detailed in Order No. 08-238  
15 for calculating this year's October Update.  
16

17 Jurisdictional Allocation of NPSE

18 **Q. How did the Company calculate the Oregon jurisdictional share of NPSE?**

19 A. The Oregon jurisdictional share of NPSE is calculated by multiplying the system NPSE  
20 total per-unit cost of \$26.83 per MWh by the forecasted Oregon jurisdictional loss-  
21 adjusted normalized sales for the April 2021 through March 2022 test period of  
22 679,939.510 MWh, resulting in an Oregon jurisdictional share of NPSE of \$18.2 million  
23 (\$26.83 x 679,939.510 MWh = \$18.2 million), as shown on Line 1 of Exhibit 109.

24 Quantification and Discussion of the APCU Revenue Requirement

25 **Q. Based on the determination of the Oregon jurisdictional share of NPSE, what is**  
26

1 **the APCU revenue requirement for the 2021 October Update?**

2 A. As shown on Line 3 of Exhibit 109, the APCU revenue requirement is \$18.39 million.  
3 The APCU revenue requirement is calculated by adding the 2021 October Update  
4 Oregon jurisdictional share of NPSE of \$18.2 million, Line 1, to the Oregon allocated  
5 EIM costs of \$146,504, Line 2.

6 **Q. What is the overall revenue impact of this year's October Update compared to**  
7 **current revenue?**

8 A. Exhibit 109 also reveals the revenue impact resulting from this year's October Update.  
9 As shown on Line 12, base NPSE recovery under current approved APCU rates is  
10 \$17.17 million, whereas the proposed 2021 APCU October Update revenue  
11 requirement is \$18.39 million, as shown on Line 3. The comparison of this year's  
12 October Update to current approved revenue indicates an increase in Oregon  
13 customer rates of \$1.2 million.

14  
15 **Rate Implementation**

16 **Q. What method of allocation did the Company use to spread the APCU revenue**  
17 **requirement associated with the 2021 October Update to the various customer**  
18 **classes?**

19 A. The Company allocated the \$18.39 million APCU revenue requirement associated  
20 with the 2021 October Update using the revenue spread methodology agreed upon in  
21 the settlement stipulation approved by Order No. 18-170<sup>11</sup>. Order No. 18-170  
22 established a revenue spread methodology whereby the total APCU revenue  
23 requirement is allocated to individual customer classes on the basis of normalized  
24

25 \_\_\_\_\_  
26 <sup>11</sup> *In the Matter of Idaho Power Company's 2018 Annual Power Cost Update*, Docket No. UE 333, Order  
No. 18-170 (May 21, 2018).

1 jurisdictional forecasted sales at the generation level for the test period. Additionally,  
2 any rate increases resulting from application of this revenue spread methodology as  
3 applied to a customer class will be capped at 3 percent above the overall average rate  
4 increase on a percentage of total revenue basis. In this case, the overall average rate  
5 change as a percentage of total revenue is an increase of 2.37 percent; therefore, any  
6 rate increases applied to individual customer classes will be capped at 5.37 percent.

7 **Q. Were any customer classes subject to the rate cap described above?**

8 A. No. Application of the stipulated revenue spread methodology results in rate changes  
9 for all individual customer classes below the 5.37 percent cap. The final proposed  
10 revenue spread resulting from the application of the stipulated methodology is  
11 provided in Exhibit 109.

12 **Q. Have you prepared an exhibit showing the summary of the revenue impact**  
13 **resulting from the October Update proposed by the Company?**

14 A. Yes. Exhibit 110 provides a summary of the revenue change resulting from this year's  
15 October Update as compared to current revenue.

16 **Q. Does the Company intend to provide supporting workpapers for the 2021**  
17 **October Update to Staff and CUB?**

18 A. Yes. Idaho Power will provide its supporting workpapers to Staff and CUB as part of  
19 the 2021 APCU filing. The Company intends to provide these workpapers within five  
20 business days of filing the 2021 APCU.

21 **Q. Does this conclude your testimony?**

22 A. Yes, it does.  
23  
24  
25
